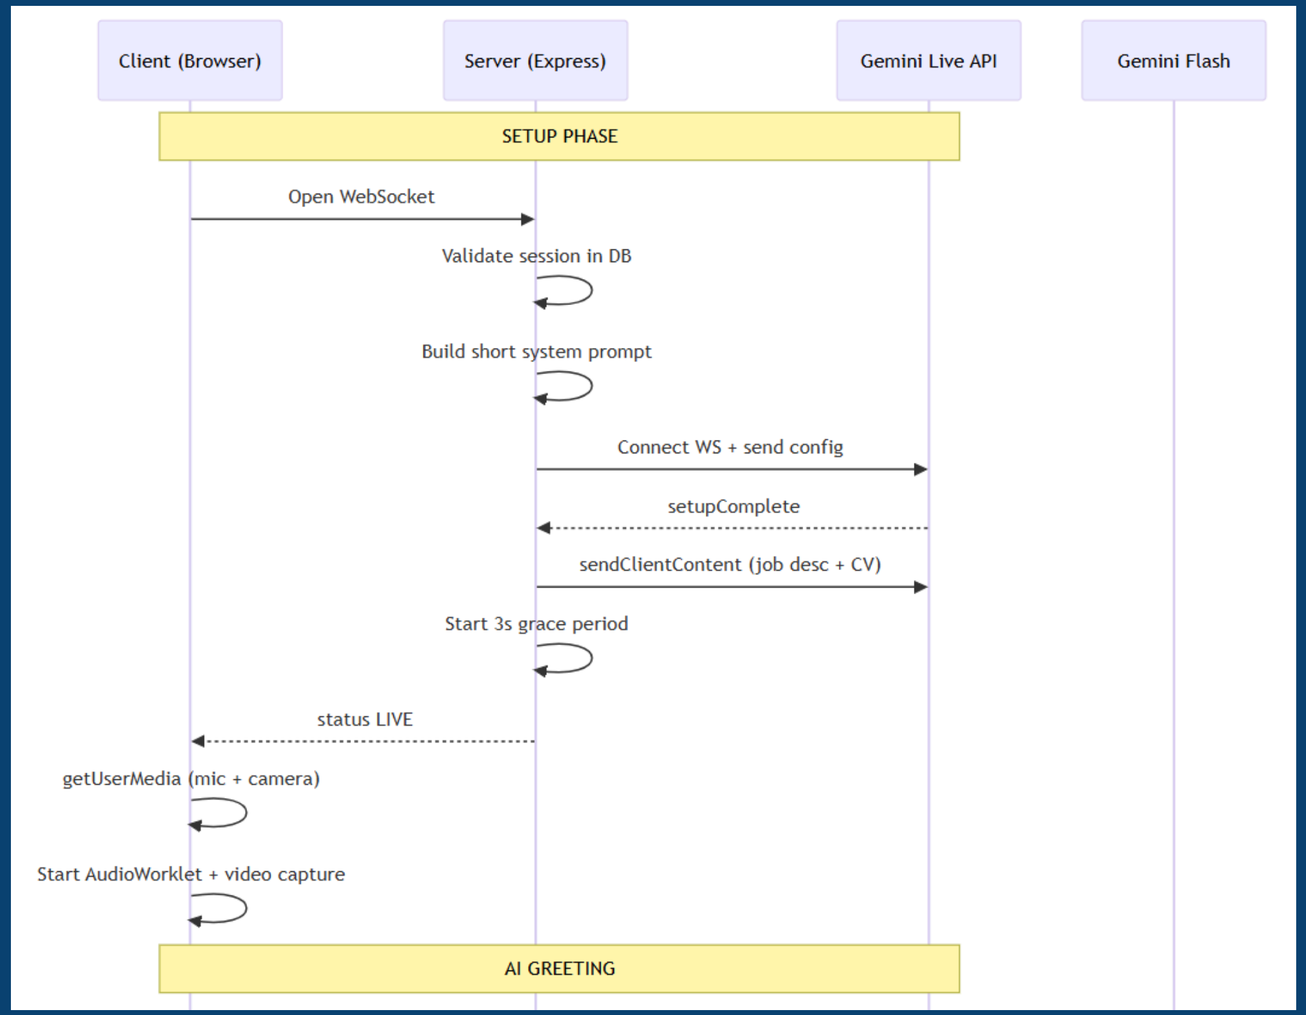
Interview Live

Architecture Diagram

Gemini Live Agent Challenge 2026
Live Agents

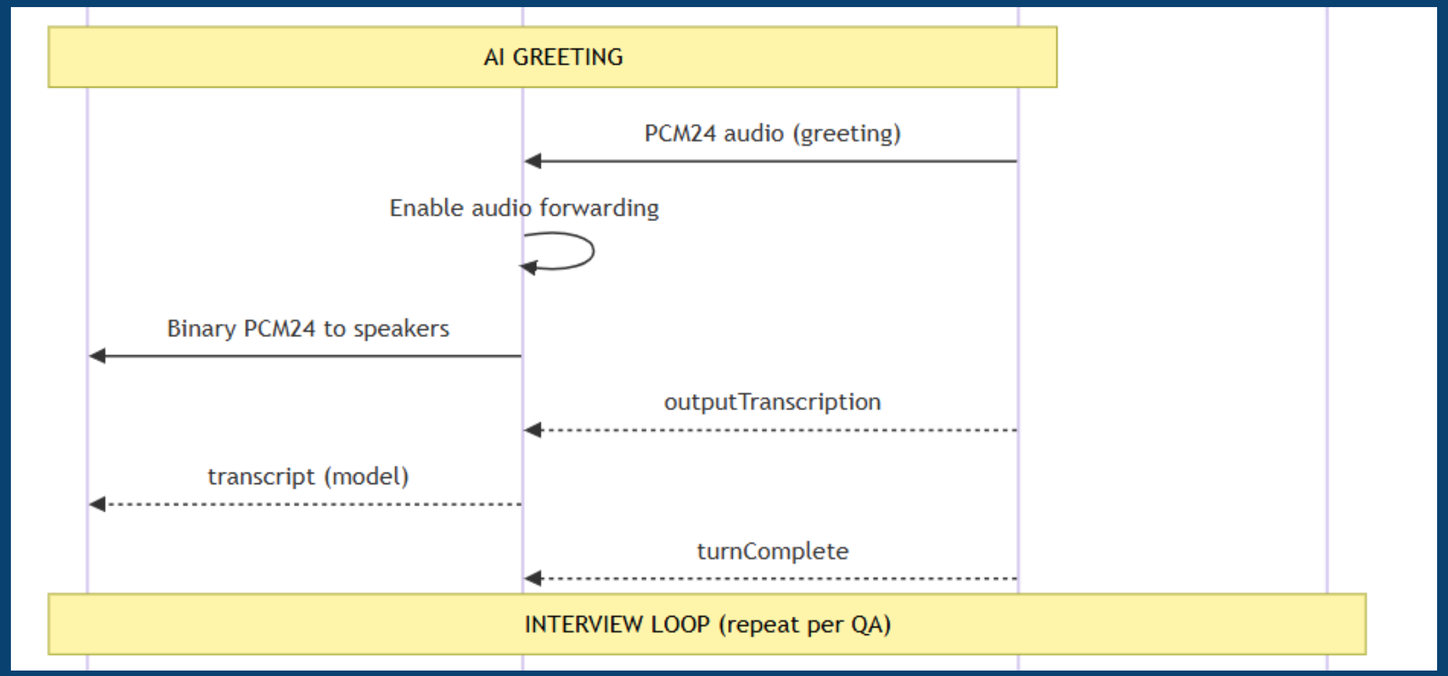
Architecture Diagram



Setup Phase

The client opens a WebSocket connection. The server validates the session, securely injects the CV and job details, and initiates a three second grace period before capturing user media

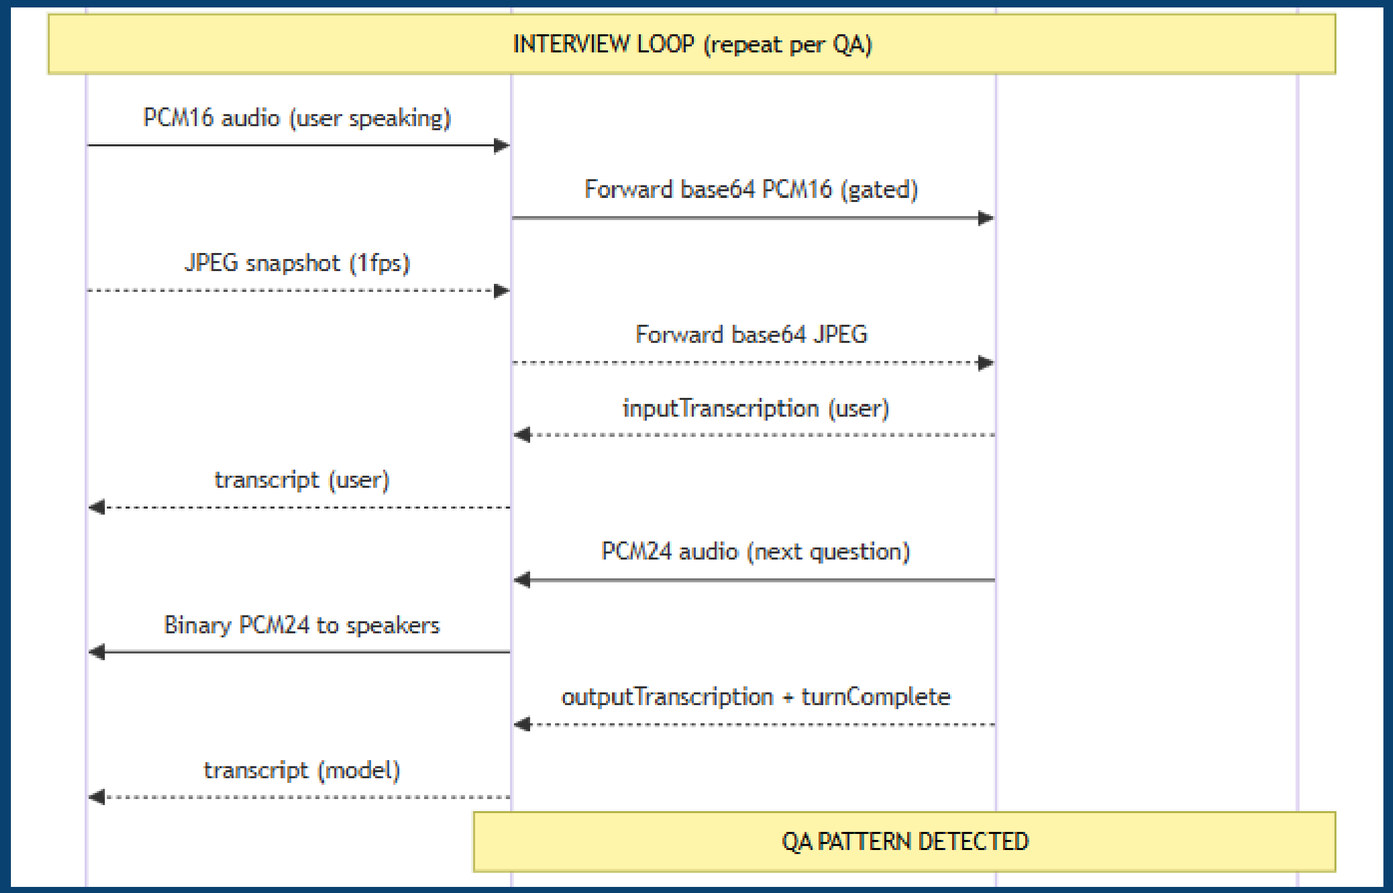
Architecture Diagram



AI Greeting

The Gemini Live API streams the initial conversational audio greeting and text transcript directly to the user

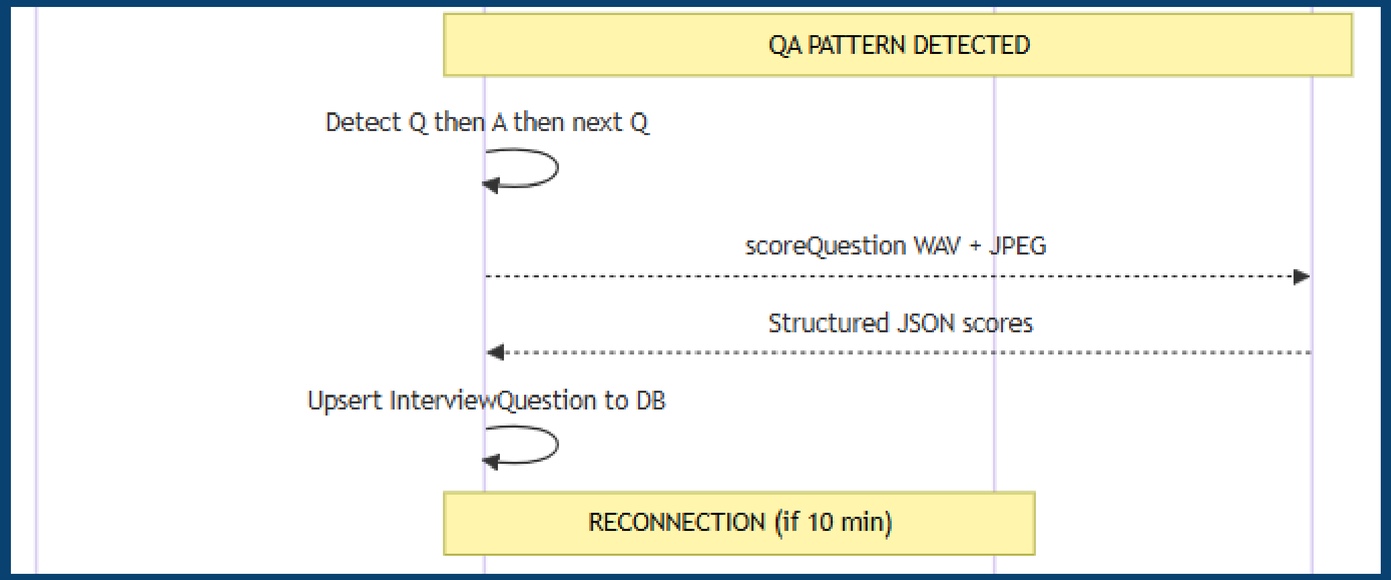
Architecture Diagram



Interview Loop

TThe browser continuously streams user voice as raw PCM16 audio and one JPEG snapshot per second. The server forwards this media to the Gemini Live API. Gemini transcribes the speech and replies with the next question via PCM24 audio. The server instantly relays this back to the user speakers to complete the turn.

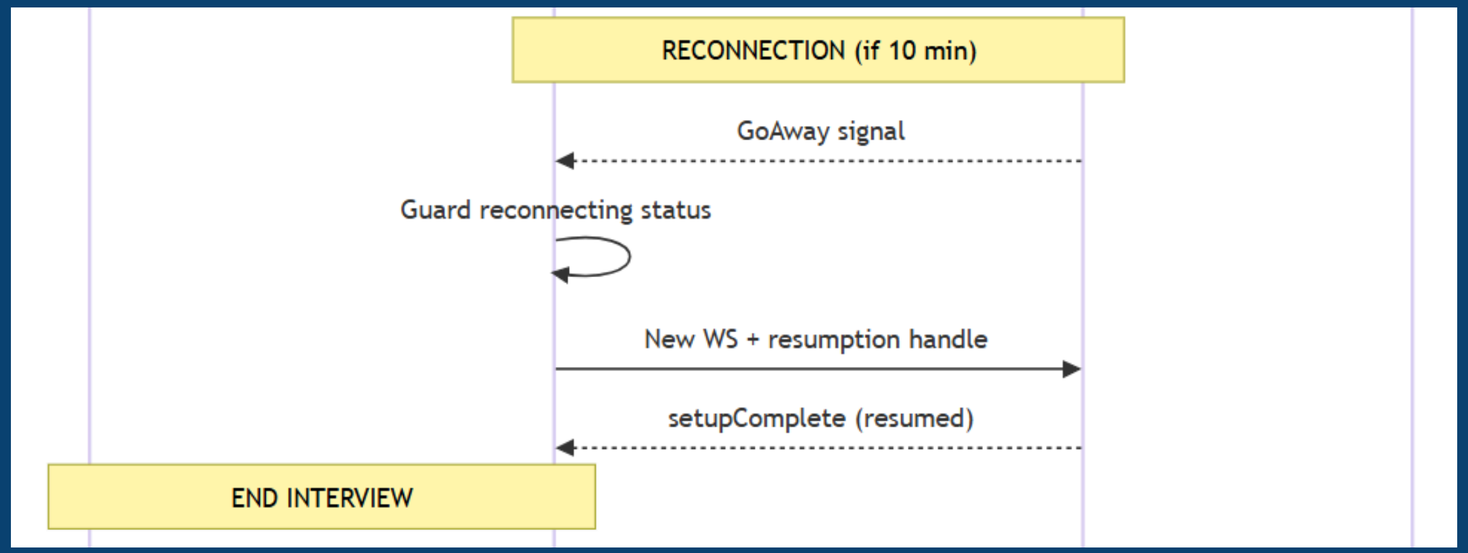
Architecture Diagram



Pattern Detection and Scoring

Once a full question and answer cycle completes, the server isolates the raw media and sends it to a background Gemini Flash model for instant evaluation.

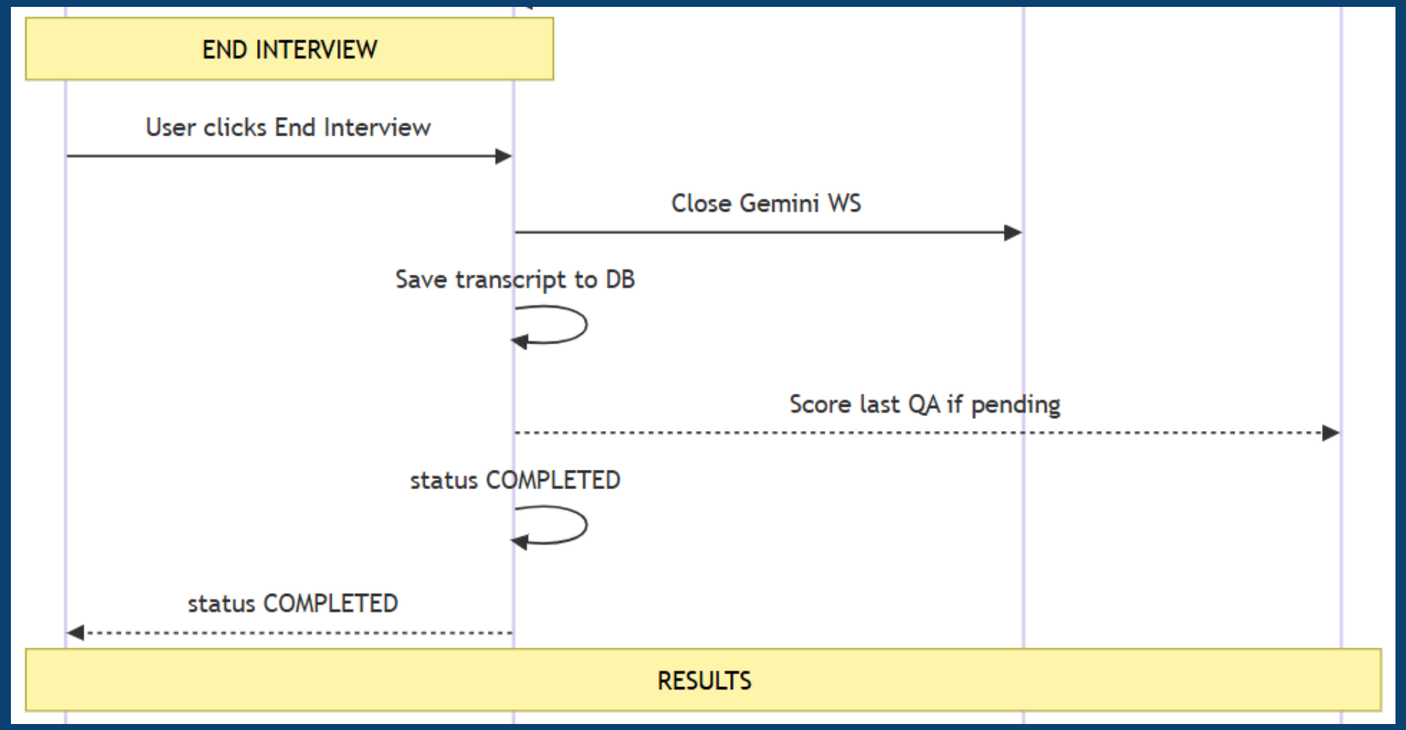
Architecture Diagram



Transparent Reconnection

The server intelligently intercepts the ten minute timeout signal, automatically resuming the connection without disrupting the live user experience.

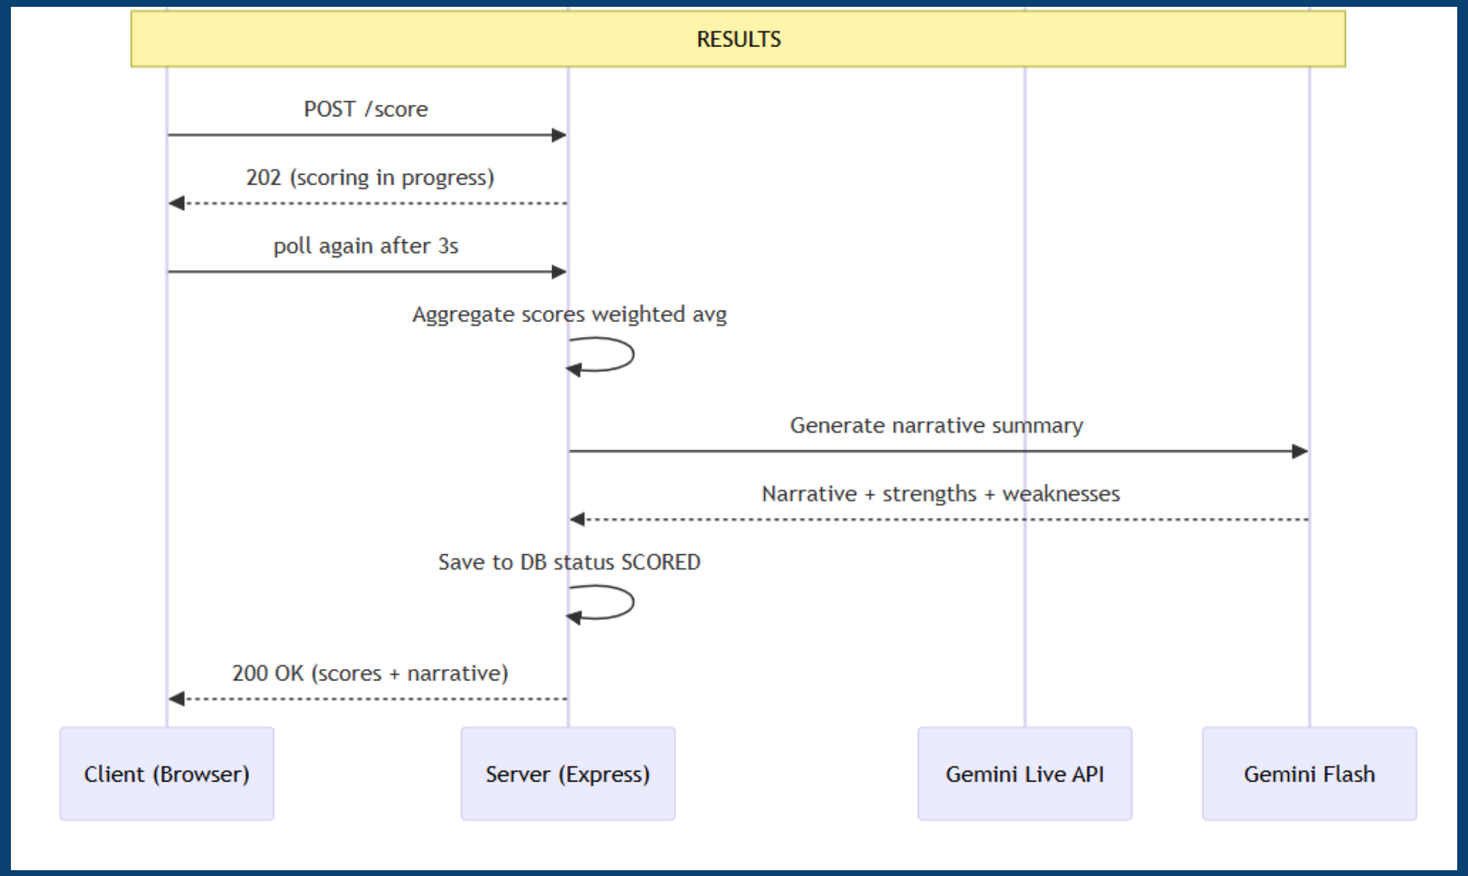
Architecture Diagram



End Interview

The user concludes the session. The server closes the WebSocket connection, saves the final data, and processes any remaining evaluations.

Architecture Diagram



Results Generation

The server aggregates all individual scores, uses Gemini Flash to write a comprehensive narrative summary, and delivers the final evaluation dashboard to the user.
